Minmax's MAU100 1W DC/DC's are specially designed to provide the optimum cost/benefit power solution in a miniature SIP package.

The series consists of 33 models with input voltages of 5V, 12V, 15V and 24VDC which offers standard output voltages of 3.3V, 5V, 9V, 12V, 15V, ±5V, ±9V, ±12V and ±15VDC for a wide choice.

The MAU100 series is an excellent selection for a variety of applications including distributed power systems, mixed analog/digital subsystems, portable test equipments, local power networks and battery backed systems.

Key Features

- Efficiency up to 81%
- 1000VDC Isolation
- MTBF > 2,000,000 Hours
- Low Cost
- Input 5, 12, 15 and 24VDC
- Output 3.3, 5, 9, 12, 15, ±5, ±9, ±12 and ±15VDC
- Temperature Performance -40°C to +85°C
- UL 94V-0 Package Material
- Internal SMD Construction
- Industry Standard Pinout

| Internal Power Dissipation            | ---- | 450 mW|

Exceeding the absolute maximum ratings of the unit could cause damage. These are not continuous operating ratings.

### Notes:

1. Specifications typical at Ta=+25°C, resistive load, nominal input voltage, rated output current unless otherwise noted.
2. Ripple & Noise measurement bandwidth is 0–20 MHz.
3. These power converters require a minimum output loading to maintain specified regulation.
4. Operation under no-load conditions will not damage these modules; however, they may not meet all specifications listed.
5. All DC/DC converters should be externally fused at the front end for protection.
6. Other input and output voltage may be available, please contact factory.
7. Specifications subject to change without notice.

MAU100 Series

REV:0 2005/04 MINMAX
**Test Configurations**

**Input Reflected-Ripple Current Test Setup**

Input reflected-ripple current is measured with an inductor \(L_{in} (4.7\mu H)\) and \(C_{in} (220\mu F, \text{ESR} < 1.0\Omega \text{ at } 100 \text{ KHz})\) to simulate source impedance.

Capacitor \(C_{in}\), offsets possible battery impedance. Current ripple is measured at the input terminals of the module, measurement bandwidth is 0–500 KHz.

**Peak-to-Peak Output Noise Measurement Test**

Use a \(C_{out} 0.33\mu F\) ceramic capacitor. Scope measurement should be made by using a BNC socket, measurement bandwidth is 0–20 MHz. Position the load between 50 mm and 75 mm from the DC/DC Converter.

**Design & Feature Considerations**

**Maximum Capacitive Load**

The MAU100 series has limitation of maximum connected capacitance at the output.

The power module may be operated in current limiting mode during start-up, affecting the ramp-up and the startup time.

For optimum performance we recommend 100\mu F maximum capacitive load for dual outputs and 220\mu F capacitive load for single outputs.

The maximum capacitance can be found in the data sheet.

**Input Source Impedance**

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module.

**Output Ripple Reduction**

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance.

To reduce output ripple, it is recommended to use 1.0\mu F capacitors at the output.

**Thermal Considerations**

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below 90°C.

The derating curves are determined from measurements obtained in an experimental apparatus.
The MAU100 converter is encapsulated in a low thermal resistance molding compound that has excellent resistance/electrical characteristics over a wide temperature range or in high humidity environments. The encapsulant and unit case are both rated to UL 94V-0 flammability specifications. Leads are tin plated for improved solderability.
