

## Dual Input Synchronous MOSFET Driver

### Features:

- Ideally suited to drive low Figure-of-Merit (FOM) MOSFETs such as Microchip's MCP87000 MOSFET family
- Independent PWM Input Control for High-Side and Low-Side Gate Drive
- Input Logic Level Threshold 3.0V TTL Compatible
- Dual Output MOSFET Drive for Synchronous Applications
- High Peak Output Current: 2A (typical)
- Internal Bootstrap Blocking Device
- +36V BOOT Pin Maximum Rating
- Low Supply Current: 45  $\mu$ A (typical)
- High Capacitive Load Drive Capability:
  - 3300 pF in 10.0 ns (typical)
- Input Voltage Undervoltage Lockout Protection
- Overtemperature Protection
- Space Saving Packages:
  - 8-Lead SOIC
  - 8-Lead 3x3 DFN

### Applications:

- 3-Phase BLDC Motor Control
- High Efficient Synchronous DC/DC Buck Converters
- High-Current Low Output Voltage Synchronous DC/DC Buck Converters
- High Input Voltage Synchronous DC/DC Buck Converters
- Core Voltage Supplies for Microprocessors

### General Description:

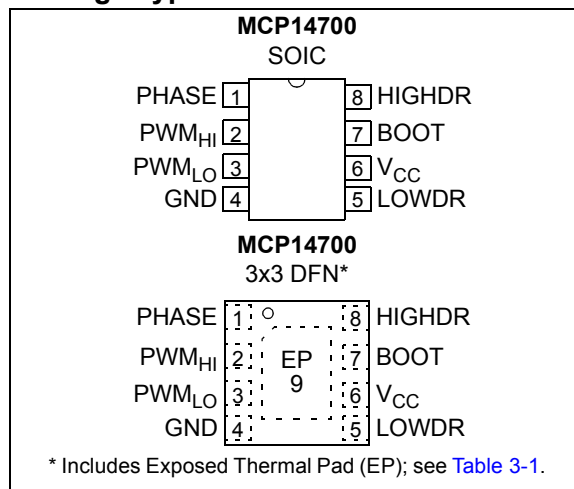

The MCP14700 is a high-speed synchronous MOSFET driver designed to optimally drive a high-side and low-side N-Channel MOSFET. It is particularly well suited for driving low-FOM MOSFETs, including Microchip's MCP87000 family of high-speed MOSFETs. The MCP14700 has two PWM inputs to allow independent control of the external N-Channel MOSFETs. Since there is no internal cross conduction protection circuitry the external MOSFET dead time can be tightly controlled allowing for more efficient systems or unique motor control algorithms.

The transition thresholds for the PWM inputs are typically 1.6V on a rising PWM input signal and typically 1.2V on a falling PWM input signal. This makes the MCP14700 ideally suited for controllers that utilize 3.0V TTL/CMOS logic. The PWM inputs are internally pulled low ensuring the output drive signals are low if the inputs are floating.

The HIGHDR and LOWDR peak source current capability of the MCP14700 device is typically 2A. While the HIGHDR can sink 2A peak typically, the LOWDR can sink 3.5A peak typically. The low resistance pull-up and pull-down drive allow the MCP14700 to quickly transition a 3300 pF load in typically 10 ns. Bootstrapping for the high-side drive is internally implemented which allows for a reduced system cost and design complexity.

The MCP14700 features undervoltage lockout (UVLO) with a typical hysteresis of 500 mV. Overtemperature protection with hysteresis is also featured on the device.

### Package Types

## Functional Block Diagram

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

$V_{CC}$ .....	-0.3V to +7.0V
$V_{BOOT}$ .....	-0.3V to +36.0V
$V_{PHASE}$ .....	$V_{BOOT} - 7V$ to $V_{BOOT} + 0.3V$
$V_{PWM}$ .....	-0.3V to $V_{CC} + 0.3V$
$V_{HIGHDR}$ .....	$V_{PHASE} - 0.3V$ to $V_{BOOT} + 0.3V$
$V_{LOWDR}$ .....	-0.3V to $V_{CC} + 0.3V$
ESD Protection on all Pins.....	2 kV (HBM)
.....	400V (MM)

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational sections of this specification is not intended. Exposure to maximum rating conditions for extended periods may affect device reliability.

### DC CHARACTERISTICS

**Electrical Specifications:** Unless otherwise noted,  $V_{CC} = 5.0V$ ,  $T_J = -40^{\circ}C$  to  $+125^{\circ}C$

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>V<sub>CC</sub> Supply Requirements</b>						
V <sub>CC</sub> Operating Range	$V_{CC}$	4.5	5.0	5.5	V

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: PIN FUNCTION TABLE**

MCP14700		Symbol	Description
3x3 DFN	SOIC		
1	1	PHASE	Switch Node
2	2	PWM <sub>HI</sub>	High-Side PWM Control Input Signal
3	3	PWM <sub>LO</sub>	Low-Side PWM Control Input Signal
4	4	GND	Ground
5	5	LOWDR	Low-side Gate Drive
6	6	V <sub>CC</sub>	Supply Input Voltage
7	7	BOOT	Floating Bootstrap Supply
8	8	HIGHDR	High-Side Gate Drive
9	—	EP	Exposed Metal Pad

### 3.1 Switch Node (PHASE)

The PHASE pin provides a return path for the high-side gate driver. The source of the high-side and the drain of the low-side power MOSFETs are connected to this pin.

### 3.2 High-Side PWM Control Input Signal (PWM<sub>HI</sub>)

The PWM input signal to control the high-side power MOSFET is applied to the PWM<sub>HI</sub> pin. A logic high on the PWM<sub>HI</sub> pin causes the HIGHDR pin to also transition high.

### 3.3 Low-Side PWM Control Input Signal (PWM<sub>LO</sub>)

The PWM input signal to control the low-side power MOSFET is applied to the PWM<sub>LO</sub> pin. A logic high on the PWM<sub>LO</sub> pin causes the LOWDR pin to also transition high.

### 3.4 Ground (GND)

The GND pin provides ground for the MCP14700 circuitry. It should have a low-impedance connection to the bias supply source return. High peak currents will flow out the GND pin when the low-side power MOSFET is being turned off.

### 3.5 Low-side Gate Drive (LOWDR)

The LOWDR pin provides the gate drive signal to control the low-side power MOSFET. The gate of the low-side power MOSFET is connected to this pin.

### 3.6 Supply Input Voltage (V<sub>CC</sub>)

The V<sub>CC</sub> pin provides bias to the MCP14700 device. A bypass capacitor is to be placed between this pin and the GND pin. This capacitor should be placed as close to the MCP14700 as possible.

### 3.7 Floating Bootstrap Supply (BOOT)

The BOOT pin is the floating bootstrap supply pin for the high-side gate drive. A capacitor is connected between this pin and the PHASE pin to provide the necessary charge to turn on the high-side power MOSFET.

### 3.8 High-Side Gate Drive (HIGHDR)

The HIGHDR pin provides the gate drive signal to control the high-side power MOSFET. The gate of the high-side power MOSFET is connected to this pin.

### 3.9 Exposed Metal Pad (EP)

The exposed metal pad of the DFN package is not internally connected to any potential. Therefore, this pad can be connected to a ground plane or other copper plane on a printed circuit board to aid in heat removal from the package.

## 4.0 DETAILED DESCRIPTION

### 4.1 Device Overview

The MCP14700 is a synchronous MOSFET driver with dual independent PWM inputs capable of controlling both a ground referenced and floating N-Channel MOSFET. The PWM input threshold levels are truly 3.0V logic tolerant and have 400 mV of typical hystereses making the MCP14700 ideal for use with low-voltage controllers.

The MCP14700 is capable of supplying 2A (typical) peak current to the floating high-side MOSFET that is connected to the HIGHDR. With the exception of a capacitor, all of the circuitry needed to drive this high-side N-channel MOSFET is internal to the MCP14700. A blocking device is placed between the  $V_{CC}$  and BOOT pins that allows the bootstrap capacitor to be charged to  $V_{CC}$  when the low-side power MOSFET is conducting. Refer to the application section, [Section 5.1 “Bootstrap Capacitor Select”](#), for information on determining the proper size of the bootstrap capacitor. The HIGHDR is also capable of sinking 2A (typical) peak current.

The LOWDR is capable of sourcing 2A (typical) peak current and sinking 3.5A (typical) peak current. This helps ensure that the low-side MOSFET stays turned off during the high dv/dt of the PHASE node.

### 4.2 PWM Inputs

A logic high on either PWM pin causes the corresponding output drive signal to be high. See [Figure 4-1](#) and [Figure 4-2](#) for a graphical representation of the MCP14700 operation. Internally the PWM pins are pulled to ground to ensure there is no drive signal to the external MOSFETs if the pins are left floating. For reliable operation, it is recommended that the rising and falling slew rate of the PWM signal be faster than 1V/50 ns.

When designing with the MCP14700 in applications where cross conduction of the external MOSFETs is not desired, care must be taken to ensure the PWM inputs have the proper timing. There is no internal cross conduction protection in the MCP14700.

### 4.3 Under Voltage Lockout (UVLO)

The UVLO feature of the MCP14700 does not allow the HIGHDR or LOWDR output to function when the input voltage,  $V_{CC}$ , is below the UVLO threshold regardless of the state of the PWM<sub>HI</sub> and PWM<sub>LO</sub> pins.

Once  $V_{CC}$  reaches the UVLO threshold, the HIGHDR and LOWDR outputs will respond to the state of the PWM<sub>HI</sub> or PWM<sub>LO</sub> pins. There is a 500 mV hystereses on the UVLO threshold.

### 4.4 Overtemperature Protection

The MCP14700 is protected from an overtemperature condition by an internal thermal shutdown feature. When the internal temperature of the MCP14700 reaches 147°C typically, the HIGHDR and LOWDR outputs will transition to a low state regardless of the state of the PWM<sub>HI</sub> or PWM<sub>LO</sub> pins. Once the internal temperature is reduced by 20°C typically, the MCP14700 will automatically respond to the states of the PWM<sub>HI</sub> and PWM<sub>LO</sub> pins.

### 4.5 Timing Diagram

The PWM signal applied to the MCP14700 is supplied by a controller IC. The timing diagram in [Figure 4-1](#) graphically depicts the PWM signal and the output signals of the MCP14700.

**FIGURE 4-1:** MCP14700 LOWDR Timing Diagram.

# MCP14700

FIGURE 4-2: MCP14700 HIGHDR Timing Diagram.

## 5.0 APPLICATION INFORMATION

### 5.1 Bootstrap Capacitor Select

The selection of the bootstrap capacitor is based upon the total gate charge of the high-side power MOSFET and the allowable droop in gate drive voltage while the high-side power MOSFET is conducting.

#### EQUATION 5-1:

$$C_{BOOT} \geq \frac{Q_{GATE}}{\Delta V_{DROOP}}$$

Where:

$C_{BOOT}$  = Bootstrap capacitor value

$Q_{GATE}$  = Total gate charge of the high-side MOSFET

$\Delta V_{DROOP}$  = Allowable gate drive voltage droop

For example:

$$Q_{GATE} = 30 \text{ nC}$$

$$\Delta V_{DROOP} = 200 \text{ mV}$$

$$C_{BOOT} \geq 0.15 \text{ }\mu\text{F}$$

A low ESR ceramic capacitor is recommended with a maximum voltage rating that exceeds the maximum input voltage,  $V_{CC}$ , plus the maximum supply voltage,  $V_{SUPPLY}$ . It is also recommended that the capacitance of  $C_{BOOT}$  does not exceed 1.2  $\mu\text{F}$ .

### 5.2 Decoupling Capacitor

Proper decoupling of the MCP14700 is highly recommended to help ensure reliable operation. This decoupling capacitor should be placed as close to the MCP14700 as possible. The large currents required to quickly charge the capacitive loads are provided by this capacitor. A low ESR ceramic capacitor is recommended.

### 5.3 Power Dissipation

The power dissipated in the MCP14700 consists of the power loss associated with the quiescent power and the gate charge power.

The quiescent power loss can be calculated by the following equation and is typically negligible compared to the gate drive power loss.

#### EQUATION 5-2:

$$P_Q = I_{VCC} \times V_{CC}$$

Where:

$P_Q$  = Quiescent power loss

$I_{VCC}$  = No Load Bias Current

$V_{CC}$  = Bias Voltage

The main power loss occurs from the gate charge power loss. This power loss can be defined in terms of both the high-side and low-side power MOSFETs.

#### EQUATION 5-3:

$$P_{GATE} = P_{HIGHDR} + P_{LOWDR}$$

$$P_{HIGHDR} = V_{CC} \times Q_{HIGH} \times F_{SW}$$

$$P_{LOWDR} = V_{CC} \times Q_{LOW} \times F_{SW}$$

Where:

$P_{GATE}$  = Total Gate Charge Power Loss

$P_{HIGHDR}$  = High-Side Gate Charge Power Loss

$P_{LOWDR}$  = Low-Side Gate Charge Power Loss

$V_{CC}$  = Bias Supply Voltage

$Q_{HIGH}$  = High-Side MOSFET Total Gate Charge

$Q_{LOW}$  = Low-Side MOSFET Total Gate Charge

$F_{SW}$  = Switching Frequency

# MCP14700

## 5.4 PCB Layout

Proper PCB layout is important in a high current, fast switching circuit to provide proper device operation. Improper component placement may cause errant switching, excessive voltage ringing, or circuit latch-up.

There are two important states of the MCP14700 outputs, high and low. [Figure 5-1](#) depicts the current flow paths when the outputs of the MCP14700 are high and the power MOSFETs are turned on. The charge needed to turn on the low-side power MOSFET comes from the decoupling capacitor  $C_{VCC}$ . The current flows from this capacitor through the internal LOWDR circuitry, into the gate of the low-side power MOSFET, out the source, into the ground plane, and back to  $C_{VCC}$ . To reduce any excess voltage ringing or spiking, the inductance and area of this current loop must be minimized.

**FIGURE 5-1:** Turn On Current Paths.

The charge needed to turn on the high-side power MOSFET comes from the bootstrap capacitor  $C_{BOOT}$ . Current flows from  $C_{BOOT}$  through the internal HIGHDR circuitry, into the gate of the high-side power MOSFET, out the source and back to  $C_{BOOT}$ . The printed circuit board traces that construct this current loop need to have a small area and low inductance. To control the inductance, short and wide traces must be used.

[Figure 5-2](#) depicts the current flow paths when the outputs of the MCP14700 are low and the power MOSFETs are turned off. These current paths should also have low inductance and a small loop area to minimize the voltage ringing and spiking.

**FIGURE 5-2:** Turn Off Current Paths.

The following recommendations should be followed for optimal circuit performance:

- The components that construct the high current paths previously mentioned should be placed close to the MCP14700 device. The traces used to construct these current loops should be wide and short to keep the inductance and impedance low.
- A ground plane should be used to keep both the parasitic inductance and impedance minimized. The MCP14700 device is capable of sourcing and sinking high peak current and any extra parasitic inductance or impedance will result in non-optimal performance.

## 6.0 PACKAGING INFORMATION

### 6.1 Package Marking Information

8-Lead DFN (3x3)

Device	Code
MCP14700	DABR

**Note:** Applies to 8-Lead 3x3 DFN

Example:

8-Lead SOIC (150 mil)

Example:

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.
